Information about the new press release "Secondary Sector Production, Orders and Turnover Statistics"

The published figures come from two separately conducted statistics:

1) **Industry Production, Orders and Turnover Statistics (INDPAU):**
   For production and turnover, monthly rates of change will be published. For orders, quarterly indices and rates of change compared to the previous year will be published. All information can be found at www.indpau.bfs.admin.ch

2) **Production, Orders and Turnover Statistics for the Construction Industry (BAPAU):**
   For turnover, production and orders, quarterly changes in comparison to the previous year will be published. All information can be found at www.bapau.bfs.admin.ch/

The results are now published for the entire secondary sector, composed of industry and construction. The weighting used is based on the 2010 National Accounts.

The results of the secondary sector (INDPAU and BAPAU) are available at: www.statistics.admin.ch >Topics > Industry and Services > Production, turnover > Indicators > Secondary sector

Methodological notice:

The **Industry Production, Orders and Turnover Statistics** is a quarterly survey. The random sample comprises some 4500 companies.

The Swiss Federal Office for Energy (SFOE), the Swiss organisation responsible for the compulsory stockpiling of oil products (CARBURA) and the Swiss Association of Gas Industry (VSG) serve as secondary sources for the statistical survey. This collaboration avoids certain economic activities having to be surveyed twice.

Among the variables surveyed are the monthly turnover figures and the quarterly orders received and on hand. The three variables are broken down by economic activity. A distinction is made by provenance (domestic/foreign) for the turnover and orders received variables.

The economic activities' production is calculated by deflating turnover by production prices.

The **Construction Production, Orders and Turnover Statistics** represent the economic development of the construction industry. The random sample is composed of roughly 3800 companies.

The Swiss Contractors' Association (SBV) conducts its own statistical survey among its members (approximately 1800 enterprises), data from which is used by the Federal Statistical Office (FSO) for the Construction Industry Production, Orders and Turnover Statistics. This coordinated approach makes it possible to avoid double surveys and eases the burden on enterprises.

Among the variables surveyed are the quarterly turnover figures, orders received and on hand. The three variables are broken down by economic activity. The economic activities' production is calculated by deflating turnover by production prices.

Both statistics are based on the General Classification of Economic Activities (NOGA) from the year 2008, which meets international standards and classifies businesses into different economic activities based on their economic activities.

In order to exclude seasonal fluctuations from the time series, data is seasonally adjusted. This is done using the X-12-ARIMA method which recalculates the entire time series every quarter. All time series will be adjusted for the number of working days (not every quarter has the same number of working days).
