Retail trade turnover in September 2016

Swiss retail trade turnover falls by 2.7%

Neuchâtel, 01.11.2016 (FSO) – **Turnover in the retail sector fell by 2.7% in nominal terms in September 2016 compared with the previous year. This decline has been ongoing since January 2015. Seasonally adjusted, nominal turnover fell by 0.1% compared with the previous month. These are provisional findings from the Federal Statistical Office (FSO).**

Real turnover in the retail sector also adjusted for sales days and holidays fell by 2.3% in September 2016 compared with the previous year. Real growth takes inflation into consideration. Compared with the previous month, real, seasonally adjusted retail trade turnover registered an increase of 0.2%.

Retail sector excluding service stations

Adjusted for sales days and holidays, the retail sector excluding service stations showed a 2.7% decrease in nominal turnover in September 2016 compared with September 2015 (in real terms -2.4%). Retail sales of food, drinks and tobacco registered an increase in nominal turnover of 0.6% (in real terms +0.2%), whereas the non-food sector registered a nominal negative of 5.8% (in real terms -4.4%).

Excluding service stations, the retail sector showed a seasonally adjusted decline in nominal turnover of 0.2% compared with the previous month (in real terms +0.2%). Retail sales of food, drinks and tobacco registered a nominal stagnation (in real terms +0.4%). The non-food sector showed a minus of 0.8% (in real terms -0.5%).

Media Office

Methodological notice:

Unadjusted, adjusted for calendar effects and seasonally adjusted time series are available. A breakdown by commodity groups and by business size is also available: only unadjusted figures are calculated for this breakdown.

The results are presented in index form (2010=100) as well in nominal and real terms. The real values are obtained by adjusting the nominal values for price changes using the Swiss Consumer Price Index (CPI).

Data are seasonally adjusted in order to exclude seasonal fluctuations from the time series. This is done using the X12-ARIMA method. On each occasion the whole time series is re-calculated. Furthermore all time series are adjusted for calendar effects (not every month has the same number of sales days and holidays). The method used for calendar adjustment is to estimate the calendar effect by means of a regression model.

The detailed results for the current month will be published in the next press release in one month's time, together with first estimates for the following month, and will also be available online on the Statistics Portal: www.dhu.bfs.admin.ch

Information concerning the survey:

In 2015 the retail trade turnover statistics were completely revised. The random sample comprises some 4000 companies. It is a monthly survey, with small-sized companies being asked to provide monthly turnover figures on a quarterly basis.

The statistics are based on the General Classification of Economic Activities (NOGA) from the year 2008, which meets international standards and classifies businesses into different economic activities based on their economic activities.
